```
package com.prototype.deepclone;
import java.io. Serializable;
public class DeepCloneableTarget implements Serializable, Cloneable {
  *
  */
 private static final long serialVersionUID = 1L;
 private String cloneName;
 private String cloneClass;
 //构造器
 public DeepCloneableTarget(String cloneName, String cloneClass) {
   this.cloneName = cloneName;
   this.cloneClass = cloneClass;
 }
 //因为该类的属性,都是String,因此我们这里使用默认的clone完成即可
 @Override
 protected Object clone() throws CloneNotSupportedException {
   return super.clone();
 }
}
```
