```
package com.interpreter;
import java.util.HashMap;
import java.util.Stack;
public class Calculator {
 // 定义表达式
 private Expression expression;
 // 构造函数传参, 并解析
 public Calculator(String expStr) { // expStr = a+b
   // 安排运算先后顺序
   Stack<Expression> stack = new Stack<>();
   // 表达式拆分成字符数组
   char[] charArray = expStr.toCharArray();// [a, +, b]
   Expression left = null;
   Expression right = null;
   //遍历我们的字符数组, 即遍历 [a, +, b]
   //针对不同的情况, 做处理
   for (int i = 0; i < charArray.length; i++) {
     switch (charArray[i]) {
     case '+': //
      left = stack.pop();// 从stack取出left => "a"
       right = new VarExpression(String.valueOf(charArray[++i]));// 取出右表达式
"b"
      stack.push(new AddExpression(left, right));// 然后根据得到left 和 right 构建
AddExpresson加入stack
      break:
     case '-': //
      left = stack.pop();
      right = new VarExpression(String.valueOf(charArray[++i]));
      stack.push(new SubExpression(left, right));
      break:
     default:
      //如果是一个 Var 就创建要给 VarExpression 对象,并push到 stack
      stack.push(new VarExpression(String.valueOf(charArray[i])));
      break;
     }
   //当遍历完整个 charArray 数组后, stack 就得到最后Expression
   this.expression = stack.pop();
 }
 public int run(HashMap < String, Integer > var) {
```

```
//最后将表达式a+b和 var = {a=10,b=20}
//然后传递给expression的interpreter进行解释执行
return this.expression.interpreter(var);
}
}
```
